Technical Skills

Languages: Python, Java (17/21), C++, SQL, PL/SQL, HTML, CSS, TypeScript, JavaScript, C, Go
Frameworks: Spring Boot, Spring MVC, Hibernate/JPA, pandas, numpy, React.js, PyTorch, TensorFlow, OpenCV, skikit-learn, YOLO
Developer Tools: Git, Github, Bitbucket, Docker, Maven, Gradle, Postman, AWS, Azure, GCP, Databricks, Spark Power BI, Tableau, Vite
Databases & Technologies: PostgreSQL SQL, Oracle, SQL server, MongoDB, REST APIs, ROS 2, Arduino, I^2C, UART, RAG

Experience

Full-Stack Software Engineering Intern - MJVA Technology Ltd. January 2026 - August 2026

- Developed secure RESTful APIs using Java 17/21 and Spring Boot to integrate enterprise applications with Moneris financial gateways
- Optimized SQL/PLSQL queries, stored procedures, and triggers across Oracle and SQL server processing structured JSON/XML data
- Configured Maven build workflows and automated CI/CD deployment pipelines, validating backend services, RESTful API functionality, and application reliability using JUnit and Postman across multiple development and testing environments
- Managed Git and Bitbucket repositories, maintaining branch consistency through feature branches, pull requests, code reviews, debugging, and Agile Scrum development workflows to support code quality and integration across enterprise development projects
- Applied Power BI and Tableau to analyze business data, create visual reports, and present findings to stakeholders

Projects

Computer Vision Food Recognition and Nutritional Analysis System

Python, PyTorch, YOLO, OpenCV, NumPy, pandas, TensorFlow June 2025 - October 2026

- Built a real-time food detection app that finds and identifies 5 food categories in live webcam video, replacing an earlier TensorFlow classifier (96% test accuracy) with a fine-tuned YOLO11 model that boxes each food and detects several items at once
- Trained the model on 245 labeled images, reaching 98% mAP50 on a validation set averaging ~13.5 FPS across 300 frames
- Ran a 5-month pilot with 6 peers and family members, with a visually impaired participant who used TTS to access nutrition feedback supporting nutrition-aware choices; participants reported healthier eating habits and an average 1.1% reduction in body-fat percentage

Recall - AI Study Assistant Chrome Extension

Java 21, Spring Boot, React, TypeScript, PostgreSQL, SQL, Vite, CSS, Git, npm, Vite October 2026 - Present

- Built a chrome Manifest V3 side-panel extension with React and TypeScript that generates fill-in-the-blank quizzes from pasted or uploaded course notes with Hints On/Off modes & retry of missed questions
- Designed a Java 21 and Spring Boot REST API backed by PostgreSQL that persists quizzes, questions and attempts across sessions

Drone Behaviour Tree Telemetry System

Python, ROS 2, MAVLink MAVROS, py_trees, Docker, ArduPilot SITL, Git Sept 2026 - Oct 2026

- Engineered a ROS 2 behaviour tree telemetry system to provide ground operations with autonomy state visibility without LTE connectivity, encoding active behaviours into compact MAVLink STATUSTEXT messages targeting ≤ 50-byte payloads
- Implemented automated behaviour-to-ID mapping and parent-child relationship tracking from live ROS 2 snapshots, using efficient bandwidth identifiers, and 2 transmission mechanisms (event-driven state updates and 30 second retransmission)
- Validated 4 autonomy states (Takeoff, FlyToWaypoint, RepeatLap, and WaitForReconComplete) through end-to-end integration testing with Docker, ArduPilot SITL, MAVROS, and Mission Planner, confirming successful MAVLink STATUSTEXT reception in the ground

Autonomous Robot Navigation & LiDAR Mapping - WATonomous

C++, ROS2, Foxglove, Docker Sept 2026

- Built a 4-node C++/ROS 2 navigation system integrating LiDAR mapping, odometry fusion, A* pathfinding, and 10Hz Pure Pursuit
- Engineered 100 x 100 m occupancy grids with 0.1m resolution, 0.65 m obstacle inflation, and 8-direction A* planning

Bedside Patient Monitoring System

Arduino UNO, C++, Embedded Programming, I2C, UART, Serial Communication, ADC October 2026 - Present

- Developed an embedded monitoring prototype integrating heart-rate sensing & 3-axis acceleration measurements to track pulse
- Implemented non-blocking sensor acquisition, signal filtering, and configurable LED alerts for activity changes which are tracked

Education

University of Waterloo - *BASc in Computer Engineering with Co-op* Sept 2026 - April 2031

- **Coursework:** C++ Programming, Physics, Linear Algebra, Calculus, Engineering Prototype and Design
